0x00. AirBnB clone - The console

Group project Python OOP 3-02-06 06:00 (GMT+03:00)

- By: Guillaume
- Weight: 5
- Project to be done in teams of 2 people (your team: John Muriithi, Chizobam Obiakarije)
- Manual QA review was done by on Feb 23, 2023 1:46 AM
- An auto review will be launched at the deadline

In a nutshell...

• Contribution: 100.0%

• Manual QA review: 0.0/48 mandatory

Auto QA review: 293.0/302 mandatory & 233.0/233 optional

• Altogether: 167.42%

Mandatory: 83.71%Optional: 100.0%Contribution: 100.0%

Calculation: 100.0% * (83.71% + (83.71% * 100.0%)) == 167.42%

Concepts

For this project, we expect you to look at these concepts:

- Python packages (/concepts/66)
- AirBnB clone (/concepts/74)

Background Context

Welcome to the AirBnB clone project!

Before starting, please read the AirBnB concept page.

First step: Write a command interpreter to manage your AirBnB objects.

This is the first step towards building your first full web application: the **AirBnB clone**. This first step is very important because you will use what you build during this project with all other following projects: HTML/CSS templating, database storage, API, front-end integration...

Each task is linked and will help you to:

- put in place a parent class (called <code>BaseModel</code>) to take care of the initialization, serialization and describilization of your future instances
- create a simple flow of serialization/deserialization: Instance <-> Dictionary <-> JSON string <-> file
- create all classes used for AirBnB (User , State , City , Place ...) that inherit from BaseModel
- create the first abstracted storage engine of the project: File storage.
- · create all unittests to validate all our classes and storage engine

What's a command interpreter?

Do you remember the Shell? It's exactly the same but limited to a specific use-case. In our case, we want to be able to manage the objects of our project:

- Create a new object (ex: a new User or a new Place)
- Retrieve an object from a file, a database etc...
- Do operations on objects (count, compute stats, etc...)
- · Update attributes of an object
- · Destroy an object

Resources

Read or watch:

- cmd module (/rltoken/8ecCwE6veBmm3Nppw4hz5A)
- cmd module in depth (/rltoken/uEy4RftSdKypoig9NFTvCg)

- · packages concept page
- (/). uuid module (/rltoken/KfL9Tqwdl69W6ttG6gTPPQ)
 - datetime (/rltoken/1d8l3jSKgnYAtA1lZfEDpA)
 - unittest module (/rltoken/IIFiMB8UmgBG2CxA0AD3jA)
 - args/kwargs (/rltoken/C a0EKbtvKdMcwlAuSlZng)
 - Python test cheatsheet (/rltoken/tgNVrKKzlWgS4dfl3mQklw)
 - cmd module wiki page (/rltoken/EvcaH9uTLlauxuw03WnkOQ)
 - python unittest (/rltoken/begh14KQA-3ov29KvD_HvA)

Learning Objectives

At the end of this project, you are expected to be able to explain to anyone (/rltoken/uV5eZkRZ XEqYbgPd-0CWw), without the help of Google:

General

- · How to create a Python package
- How to create a command interpreter in Python using the cmd module
- · What is Unit testing and how to implement it in a large project
- · How to serialize and deserialize a Class
- · How to write and read a JSON file
- How to manage datetime
- What is an UUID
- What is *args and how to use it
- What is **kwargs and how to use it
- · How to handle named arguments in a function

Copyright - Plagiarism

- You are tasked to come up with solutions for the tasks below yourself to meet with the above learning objectives.
- You will not be able to meet the objectives of this or any following project by copying and pasting someone else's work.
- You are not allowed to publish any content of this project.
- · Any form of plagiarism is strictly forbidden and will result in removal from the program.

Requirements

Python Scripts

- Allowed editors: vi, vim, emacs
- All your files will be interpreted/compiled on Ubuntu 20.04 LTS using python3 (version 3.8.5)
- · All your files should end with a new line
- The first line of all your files should be exactly #!/usr/bin/python3
- A README.md file, at the root of the folder of the project, is mandatory
- Your code should use the pycodestyle (version 2.8.*)
- All your files must be executable
- The length of your files will be tested using wc
- All your modules should have a documentation (python3 -c

```
'print( import ("my module"). doc )')
```

```
• All your classes should have a documentation (python3 -c (/) 'print(__import__("my_module").MyClass.__doc__)')
```

All your functions (inside and outside a class) should have a documentation (python3 -c 'print(__import__("my_module").my_function.__doc__)' and python3 -c 'print(__import__("my_module").MyClass.my_function.__doc__)')

• A documentation is not a simple word, it's a real sentence explaining what's the purpose of the module, class or method (the length of it will be verified)

Python Unit Tests

- Allowed editors: vi, vim, emacs
- · All your files should end with a new line
- All your test files should be inside a folder tests
- You have to use the unittest module (/rltoken/op1-rQGlw0wwwqNBsn1yaw)
- All your test files should be python files (extension: .py)
- All your test files and folders should start by test
- · Your file organization in the tests folder should be the same as your project
- e.g., For models/base_model.py, unit tests must be in: tests/test_models/test_base_model.py
- e.g., For models/user.py, unit tests must be in: tests/test models/test user.py
- All your tests should be executed by using this command: python3 -m unittest discover tests
- You can also test file by file by using this command: python3 -m unittest tests/test models/test base model.py
- All your modules should have a documentation (python3 -c
 'print(__import__("my_module").__doc__)')
- All your classes should have a documentation (python3 -c
 'print(__import__("my_module").MyClass.__doc__)')
- All your functions (inside and outside a class) should have a documentation (python3 -c 'print(__import__("my_module").my_function.__doc__)' and python3 -c 'print(__import__("my_module").MyClass.my_function.__doc__)')
- · We strongly encourage you to work together on test cases, so that you don't miss any edge case

GitHub

There should be one project repository per group. If you clone/fork/whatever a project repository with the same name before the second deadline, you risk a 0% score.

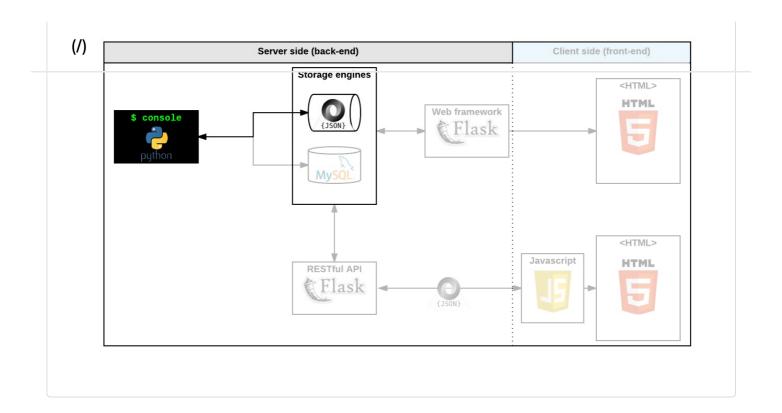

More Info

Execution

Your shell should work like this in interactive mode:

But also in non-interactive mode: (like the Shell project in C)

All tests should also pass in non-interactive mode: \$ echo "python3 -m unittest discover tests" | bash

Video library (8 total)

QA Review

0. README, AUTHORS mandatory Score: 0.0% (Checks completed: 0.0%) • Write a README.md: description of the project description of the command interpreter: how to start it how to use it examples • You should have an AUTHORS file at the root of your repository, listing all individuals having contributed content to the repository. For format, reference Docker's AUTHORS page (/rltoken/_8n_z3pf5HWi1l7uv1E9iA) · You should use branches and pull requests on GitHub - it will help you as team to organize your work Repo: • GitHub repository: AirBnB_clone • File: README.md, AUTHORS

Score: 100.0% (Checks completed: 100.0%)

Write a class BaseModel that defines all common attributes/methods for other classes:

- models/base model.py
- Public instance attributes:
 - id:string assign with an uuid when an instance is created:
 - you can use uuid.uuid4() to generate unique id but don't forget to convert to a string
 - the goal is to have unique id for each BaseModel
 - created at: datetime assign with the current datetime when an instance is created
 - updated_at: datetime assign with the current datetime when an instance is created and
 it will be updated every time you change your object
- __str__: should print: [<class name>] (<self.id>) <self.__dict__>
- · Public instance methods:
 - save(self): updates the public instance attribute updated at with the current datetime
 - to_dict(self): returns a dictionary containing all keys/values of __dict__ of the instance:
 - by using self.__dict__, only instance attributes set will be returned
 - a key class must be added to this dictionary with the class name of the object
 - created at and updated at must be converted to string object in ISO format:
 - format: %Y-%m-%dT%H:%M:%S.%f (ex: 2017-06-14T22:31:03.285259)
 - you can use isoformat() of datetime object
 - This method will be the first piece of the serialization/deserialization process: create a dictionary representation with "simple object type" of our BaseModel

```
#!/usr/bin/python3
from models.base model import BaseModel
my model = BaseModel()
my model.name = "My First Model"
my model.my number = 89
print(my model)
my model.save()
print(my model)
my model json = my model.to dict()
print(my model json)
print("JSON of my model:")
for key in my model json.keys():
    print("\t{}: ({}) - {}".format(key, type(my model json[key]), my model json[k
ey]))
guillaume@ubuntu:~/AirBnB$ ./test_base_model.py
[BaseModel] (b6a6e15c-c67d-4312-9a75-9d084935e579) {'my number': 89, 'name': 'My
First Model', 'updated at': datetime.datetime(2017, 9, 28, 21, 5, 54, 119434), 'i
d': 'b6a6e15c-c67d-4312-9a75-9d084935e579', 'created at': datetime.datetime(2017,
9, 28, 21, 5, 54, 119427)}

4. Create BaseModel from dictionary

mandatory

Score: 100.0% (Checks completed: 100.0%)

Q

Previously we created a method to generate a dictionary representation of an instance (method t(t) dict()).

Now it's time to re-create an instance with this dictionary representation.

```
<class 'BaseModel'> -> to_dict() -> <class 'dict'> -> <class 'BaseModel'>
```

Update models/base_model.py:

- __init__(self, *args, **kwargs):
 - you will use *args, **kwargs arguments for the constructor of a BaseModel. (more information inside the AirBnB clone concept page)
 - *args won't be used
 - if kwargs is not empty:
 - each key of this dictionary is an attribute name (Note __class__ from kwargs is the only one that should not be added as an attribute. See the example output, below)
 - each value of this dictionary is the value of this attribute name
 - Warning: created_at and updated_at are strings in this dictionary, but inside your BaseModel instance is working with datetime object. You have to convert these strings into datetime object. Tip: you know the string format of these datetime
 - o therwise:
 - create id and created at as you did previously (new instance)

```
millaume@ubuntu:~/AirBnB$ cat test_base_model_dict.py
 !!/usr/bin/python3
from models.base model import BaseModel
my model = BaseModel()
my_model.name = "My_First_Model"
my model.my number = 89
print(my model.id)
print(my model)
print(type(my model.created at))
print("--")
my model json = my model.to dict()
print(my model json)
print("JSON of my model:")
for key in my model json.keys():
    print("\t{}: ({}) - {}".format(key, type(my model json[key]), my model json[k
ey]))
print("--")
my_new_model = BaseModel(**my_model_json)
print(my_new_model.id)
print(my new model)
print(type(my_new_model.created_at))
print("--")
print(my model is my new model)
guillaume@ubuntu:~/AirBnB$ ./test base model dict.py
56d43177-cc5f-4d6c-a0c1-e167f8c27337
[BaseModel] (56d43177-cc5f-4d6c-a0c1-e167f8c27337) {'id': '56d43177-cc5f-4d6c-a0c
1-e167f8c27337', 'created at': datetime.datetime(2017, 9, 28, 21, 3, 54, 52298),

QA Review

5. Store first object

mandatory

Score: 100.0% (Checks completed: 100.0%)

Now we can recreate a BaseModel from another one by using a dictionary representation:

```
<class 'BaseModel'> -> to_dict() -> <class 'dict'> -> <class 'BaseModel'>
```

It's great but it's still not persistent: every time you launch the program, you don't restore all objects created before... The first way you will see here is to save these objects to a file.

Writing the dictionary representation to a file won't be relevant:

- Python doesn't know how to convert a string to a dictionary (easily)
- · It's not human readable
- Using this file with another program in Python or other language will be hard.

So, you will convert the dictionary representation to a JSON string. JSON is a standard representation of a data structure. With this format, humans can read and all programming languages have a JSON reader and writer.

Now the flow of serialization-deserialization will be:

```
<class 'BaseModel'> -> to_dict() -> <class 'dict'> -> JSON dump -> <class 'str'>
-> FILE -> <class 'str'> -> JSON load -> <class 'dict'> -> <class 'BaseModel'>
```

Magic right?

Terms:

- simple Python data structure: Dictionaries, arrays, number and string. ex: { '12': { 'numbers': [1, 2, 3], 'name': "John" } }
- **JSON string representation**: String representing a simple data structure in JSON format. ex: '{ "12": { "numbers": [1, 2, 3], "name": "John" } }'

Write a class FileStorage that serializes instances to a JSON file and deserializes JSON file to instances:

- models/engine/file_storage.py
- Private class attributes:
 - __file_path:string path to the JSON file (ex: file.json)
 - __objects: dictionary empty but will store all objects by <class name>.id (ex: to store a BaseModel object with id=12121212, the key will be BaseModel.12121212)
- · Public instance methods:
 - all(self): returns the dictionary objects
 - new(self, obj):sets in __objects the obj with key <obj class name>.id

Q

o save(self): serializes __objects to the JSON file (path: __file_path)
(/)
o reload(self): descriptions the JSON file to __objects (only if the JSON)

reload(self): deserializes the JSON file to __objects (only if the JSON file (__file_path) exists; otherwise, do nothing. If the file doesn't exist, no exception should be raised)

Update models/ init .py:to create a unique FileStorage instance for your application

- import file_storage.py
- create the variable storage, an instance of FileStorage
- call reload() method on this variable

Update models/base_model.py:to link your BaseModel to FileStorage by using the variable
storage

- import the variable storage
- in the method save (self):
 - call save(self) method of storage
- __init__(self, *args, **kwargs):
 - if it's a new instance (not from a dictionary representation), add a call to the method new (self)
 on storage

```
millaume@ubuntu:~/AirBnB$ cat test_save_reload_base_model.py
 !/usr/bin/python3
from models import storage
from models.base model import BaseModel
all objs = storage.all()
print("-- Reloaded objects --")
for obj id in all objs.keys():
    obj = all objs[obj id]
    print(obj)
print("-- Create a new object --")
my model = BaseModel()
my model.name = "My First Model"
my_model.my_number = 89
my model.save()
print(my_model)
guillaume@ubuntu:~/AirBnB$ cat file.json

6. Console 0.0.1

Score: 100.0% (Checks completed: 100.0%)

Write a program called console.py that contains the entry point of the command interpreter:

- You must use the module cmd
- Your class definition must be: class HBNBCommand(cmd.Cmd):
- Your command interpreter should implement:
 - quit and EOF to exit the program
 - help (this action is provided by default by cmd but you should keep it updated and documented as you work through tasks)
 - a custom prompt: (hbnb)
 - an empty line + ENTER shouldn't execute anything
- Your code should not be executed when imported

Warning:

You should end your file with:

```
(H) __name__ == '__main__':
HBNBCommand().cmdloop()
```

to make your program executable except when imported. Please don't add anything around - the Checker won't like it otherwise

No unittests needed

7. Console 0.1

Score: 100.0% (Checks completed: 100.0%)

Update your command interpreter (console.py) to have these commands:

- create: Creates a new instance of BaseModel, saves it (to the JSON file) and prints the id. Ex: \$ create BaseModel
 - If the class name is missing, print ** class name missing ** (ex: \$ create)
 - If the class name doesn't exist, print ** class doesn't exist ** (ex: \$ create MyModel)
- show: Prints the string representation of an instance based on the class name and id. Ex: \$ show BaseModel 1234-1234-1234.
 - If the class name is missing, print ** class name missing ** (ex: \$ show)
 - If the class name doesn't exist, print ** class doesn't exist ** (ex: \$ show MyModel)
 - If the id is missing, print ** instance id missing ** (ex: \$ show BaseModel)
 - If the instance of the class name doesn't exist for the id, print ** no instance foun

- destroy: Deletes an instance based on the class name and id (save the change into the JSON (/) file). Ex: \$ destroy BaseModel 1234-1234.
 - If the class name is missing, print ** class name missing ** (ex: \$ destroy)
 - If the class name doesn't exist, print ** class doesn't exist ** (ex: \$ destroy MyModel)
 - If the id is missing, print ** instance id missing ** (ex: \$ destroy BaseModel)
 - If the instance of the class name doesn't exist for the id, print ** no instance found ** (ex: \$ destroy BaseModel 121212)
 - all: Prints all string representation of all instances based or not on the class name. Ex: \$ all BaseModel Or \$ all.
 - The printed result must be a list of strings (like the example below)
 - If the class name doesn't exist, print ** class doesn't exist ** (ex: \$ all MyModel)
 - update: Updates an instance based on the class name and id by adding or updating attribute (save the change into the JSON file). Ex: \$ update BaseModel 1234-1234-1234 email "aibnb@mail.com".
 - Usage: update <class name> <id> <attribute name> "<attribute value>"
 - Only one attribute can be updated at the time
 - You can assume the attribute name is valid (exists for this model)
 - The attribute value must be casted to the attribute type
 - If the class name is missing, print ** class name missing ** (ex: \$ update)
 - If the class name doesn't exist, print ** class doesn't exist ** (ex: \$ update MyModel)
 - If the id is missing, print ** instance id missing ** (ex: \$ update BaseModel)
 - If the instance of the class name doesn't exist for the id, print ** no instance found ** (ex: \$ update BaseModel 121212)
 - If the attribute name is missing, print ** attribute name missing ** (ex: \$ update BaseModel existing-id)
 - If the value for the attribute name doesn't exist, print ** value missing ** (ex: \$ update BaseModel existing-id first_name)
 - All other arguments should not be used (Ex: \$ update BaseModel 1234-1234-1234 email "aibnb@mail.com" first_name "Betty" = \$ update BaseModel 1234-1234-1234 email "aibnb@mail.com")
 - id, created_at and updated_at cant' be updated. You can assume they won't be passed in the update command
 - Only "simple" arguments can be updated: string, integer and float. You can assume nobody will try to update list of ids or datetime

Let's add some rules:

- You can assume arguments are always in the right order
- · Each arguments are separated by a space
- · A string argument with a space must be between double quote
- The error management starts from the first argument to the last one

```

8. First User mandatory

Write a class User that inherits from BaseModel: (/)
• models/user.py

- Public class attributes:
 - email:string-empty string
 - password: string empty string
 - first_name: string empty string
 - last name: string empty string

Update ${\tt FileStorage}$ to manage correctly serialization and describilization of ${\tt User}$.

 $\textbf{Update your command interpreter (\verb|console.py|) to allow | \verb|show|, create|, destroy|, update| and$ all used with User.

```
millaume@ubuntu:~/AirBnB$ cat test_save_reload_user.py
 !/usr/bin/python3
from models import storage
from models.base model import BaseModel
from models.user import User
all objs = storage.all()
print("-- Reloaded objects --")
for obj id in all objs.keys():
    obj = all objs[obj id]
    print(obj)
print("-- Create a new User --")
my user = User()
my_user.first_name = "Betty"
my user.last name = "Bar"
my user.email = "airbnb@mail.com"
my_user.password = "root"
my user.save()
print(my_user)
print("-- Create a new User 2 --")
my user2 = User()
my_user2.first name = "John"
my user2.email = "airbnb2@mail.com"
my user2.password = "root"
my user2.save()
print(my_user2)

9. More classes!

mandatory

Score: 100.0% (Checks completed: 100.0%)

Write all those classes that inherit from <code>BaseModel</code>:

- State (models/state.py):
 - Public class attributes:
 - name: string empty string
- City (models/city.py):
 - Public class attributes:
 - state id:string empty string: it will be the State.id
 - name: string empty string
- Amenity (models/amenity.py):
 - Public class attributes:
 - name : string empty string
- Place (models/place.py):
 - · Public class attributes:
 - city id:string empty string: it will be the City.id
 - user id:string empty string: it will be the User.id
 - name : string empty string
 - description: string empty string
 - number rooms:integer-0
 - number_bathrooms:integer-0
 - max_guest:integer-0
 - price_by_night:integer-0
 - latitude:float 0.0
 - longitude:float 0.0
 - amenity_ids: list of string empty list: it will be the list of Amenity.id later
- Review (models/review.py):
 - · Public class attributes:
 - place_id:string empty string: it will be the Place.id
 - user_id:string empty string: it will be the User.id
 - text: string empty string

10. Console 1.0 mandatory

Score: 100.0% (Checks completed: 100.0%)

Update FileStorage to manage correctly serialization and deserialization of all our new classes:
Place, State, City, Amenity and Review

Update your command interpreter (console.py) to allow those actions: show, create, destroy, update and all with all classes created previously.

Enjoy your first console!

No unittests needed for the console

Repo:

- GitHub repository: AirBnB clone
- File: console.py, models/engine/file_storage.py, tests/

11. All instances by class name

#advanced

Score: 100.0% (Checks completed: 100.0%)

Update your command interpreter (console.py) to retrieve all instances of a class by using: <class name>.all().

```
guillaume@ubuntu:~/AirBnB$ ./console.py
(hbnb) User.all()
[[User] (246c227a-d5c1-403d-9bc7-6a47bb9f0f68) {'first_name': 'Betty', 'last_name': 'Bar', 'created_at': datetime.datetime(2017, 9, 28, 21, 12, 19, 611352), 'upd ated_at': datetime.datetime(2017, 9, 28, 21, 12, 19, 611363), 'password': '63a9f0ea7bb98050796b649e85481845', 'email': 'airbnb@mail.com', 'id': '246c227a-d5c1-403d-9bc7-6a47bb9f0f68'}, [User] (38f22813-2753-4d42-b37c-57a17f1e4f88) {'first_name': 'Betty', 'last_name': 'Bar', 'created_at': datetime.datetime(2017, 9, 28, 21, 11, 42, 848279), 'updated_at': datetime.datetime(2017, 9, 28, 21, 11, 42, 84829

17. Unittests for the Console!
                                                                                 #advanced
 Score: 100.0% (Checks completed: 100.0%)
Write all unittests for console.py, all features!
For testing the console, you should "intercept" STDOUT of it, we highly recommend you to use:
 with patch('sys.stdout', new=StringIO()) as f:
     HBNBCommand().onecmd("help show")
Otherwise, you will have to re-write the console by replacing precmd by default.
